

# RECLAMATION

*Managing Water in the West*

## Climate Change Impacts on Water Supply Predictability

**Levi Brekke (Reclamation, Technical Service Center)**

Co-Investigators: Kevin Werner (NWS CBRFC), Donald Laurine (NWS NWRFC), David Garen (NRCS NWCC)

AMS Short Course “Hydrologic Prediction and Verification Techniques with a Focus on Water Supply”, 23 January 2011, Seattle, WA (Content originally presented at MtnClim 2010, Blue River OR)

U.S. Department of the Interior  
Bureau of Reclamation

# Context

- Seasonal water supply forecasts inform Western U.S. water management
- Calendar influenced by the “snow year”
- ~Goal: predict Spring-Summer Runoff given present snowpack and antecedent precipitation

RECLAMATION

# Research Questions

- How will climate change impact seasonal water supply predictability?
  - For many western U.S. basins, snowpack contributes to predictability.
  - Loss of snowpack should eventually impact predictability (Dettinger & Culbertson 2008).
- How can we factor predictability changes into long-term assessments of reservoir operations and water management?

RECLAMATION

Study #1:  
Transient Predictability,  
eight western U.S. basins

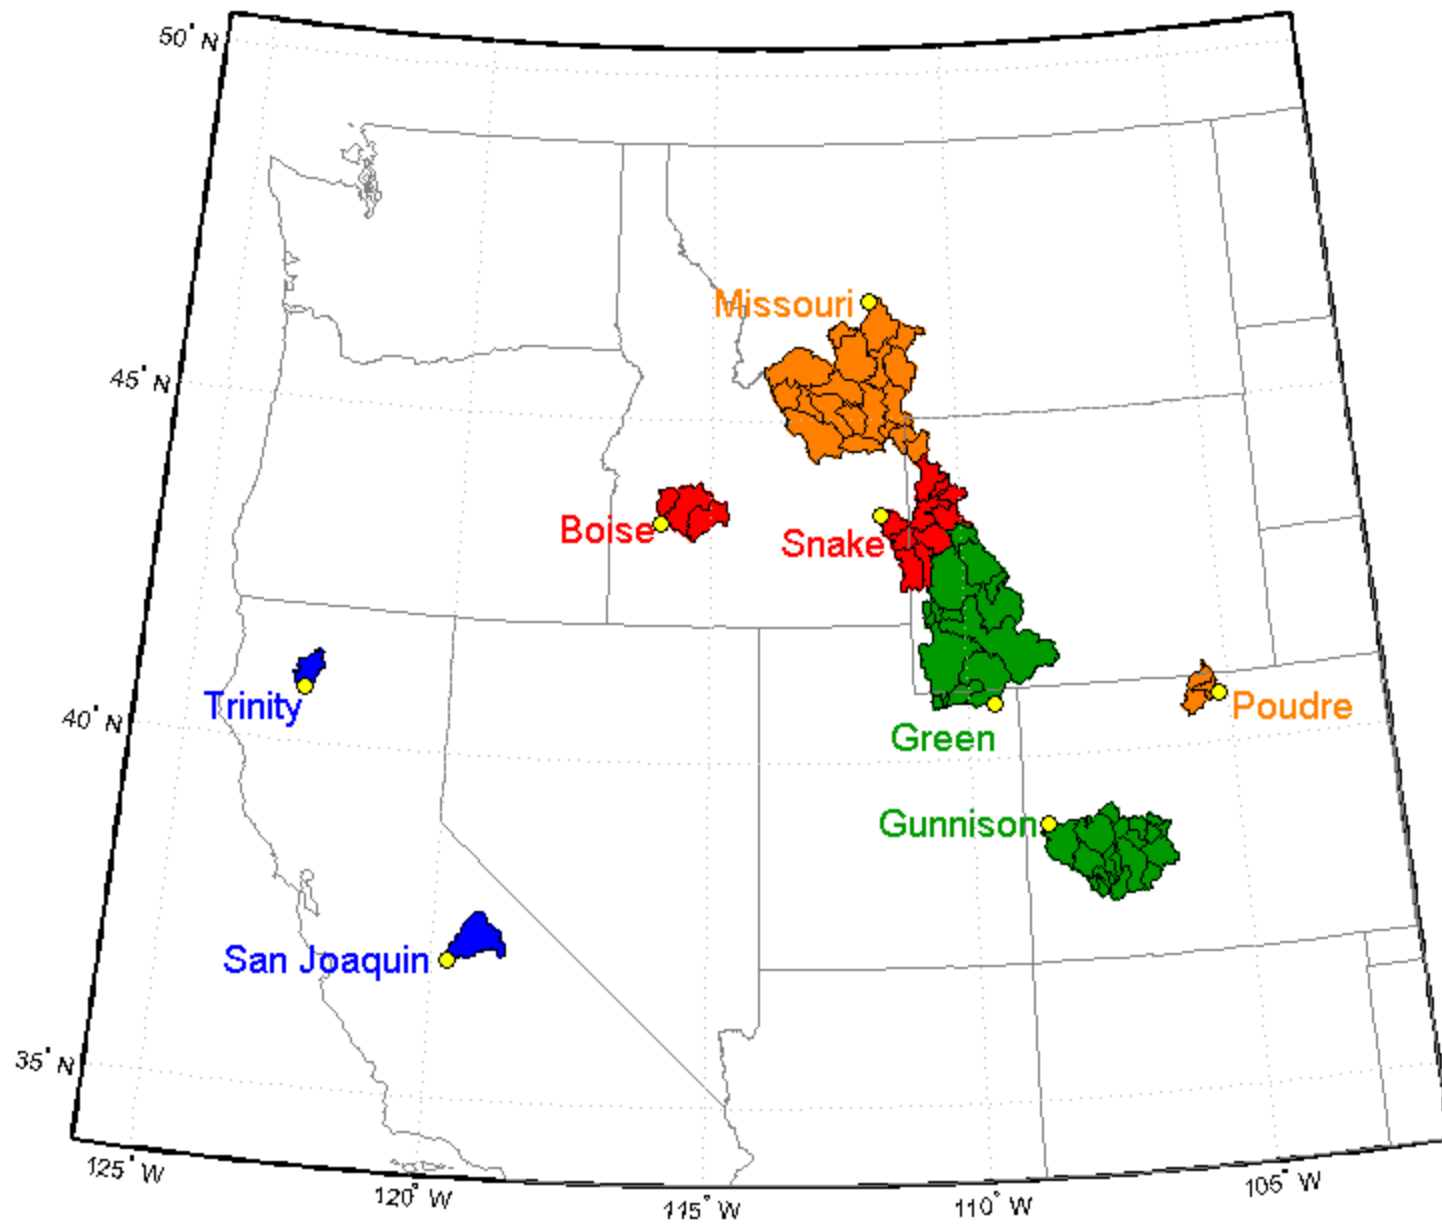

RECLAMATION

# Approach

1. Select Ensemble of Climate Projections, 1950-2099.
2. ...make Ensemble of Basin Hydroclimate Projections (P, SWE, Runoff), 1950-2099
  - process-based hydrologic simulation modeling
3. ...make Ensemble of Forecast Projections, 1981-2099
  - series of forecast models within each hydroclimate projection
  - decadal model updates, similar to NRCS procedures
4. Evaluate validation forecast skill through time as climate changes.
  - Various metrics ( $r^2$ , RMSE, ratio of RMSE to Mean Actual)

## Case Study Basins

# Selected Climate Projections (Bias-corrected, Spatially Downscaled)

[http://gdo-dcp.ucllnl.org/downscaled\\_cmip3\\_projections/](http://gdo-dcp.ucllnl.org/downscaled_cmip3_projections/)

- 112 CMIP3 Projections
  - 16 models, 3 emission scenarios, and multiple initializations for model-emissions combination
- Variables:
  - Precipitation Rate (mm/day)
  - Mean Daily Temperature (°C)
- Temporal Coverage and Resolution
  - 1950-2099, monthly
- Spatial Coverage and Resolution
  - Contiguous U.S., 1/8° (~12km x 12 km)
- Developers
  - Reclamation, Santa Clara University (Ed Maurer), LLNL

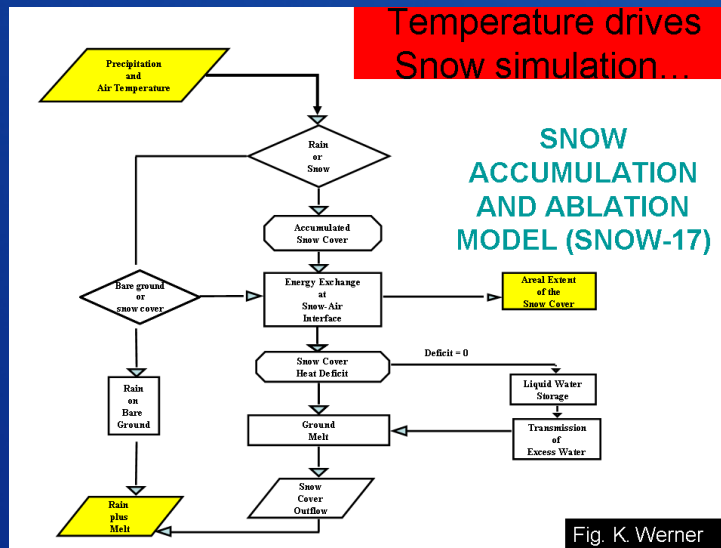

# Making Hydroclimate Projections

## Simulation Model:

SacSMA/Snow17

Basin-applications from four collaborating NWS River Forecast Centers (Missouri Basin, Northwest, Colorado Basin, California-Nevada)

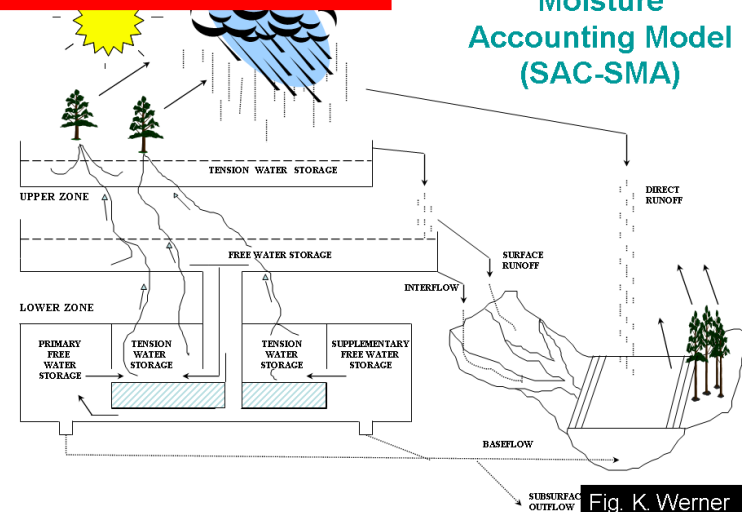

## Application:

1. generate weather inputs following Wood et al. 2004, translating from monthly BCSD data into 6-hourly weather
2. use Hamon to adjust input PET given T change
3. simulate runoff.

## Rainfall-Runoff Model

## Sacramento Soil Moisture Accounting Model (SAC-SMA)

RECLAMATION

# Example Hydroclimate Projections – Trinity Basin

# Making Forecast Projections

(~consistent with NRCS & NWS procedures)

- Statistical Framework
  - PC Regression:  $Q = \text{function of } SWE_{\text{At-Issue}} \text{ and } P_{\text{antecedent}}$
- Predictors and Predictands
  - Predictands:  $Q_{\text{Apr-Jul}}$ ,  $Q_{\text{Mar-June}}$  (Jan, Feb, Mar, Apr issues)
  - Predictors distributed by subbasins and their elevation zones
- Consolidating Predictors:
  - Focused on higher elevation zones' P & SWE
- Forecast Model Updating:
  - Calibrate to retrospective 30 years ...
  - Apply to next 10 years, get validation results...
  - Update model every 10 years ...

RECLAMATION

e.g., Trinity: (a) single projection of validation forecasts, (b) calib. correlations

RECLAMATION

# Trinity Ensemble: Hydrologic Impact ( $Q_{\text{Apr-Jul}}$ )

RECLAMATION

# Trinity Ensemble: Predictability Impact (April Issue of $Q_{\text{Apr-Jul}}$ )

RECLAMATION

# All Basins' Ensembles: Issue<sub>Apr</sub>, Q<sub>Apr-Jul</sub>, Predictability Impact

## Poudre

## San Joa.

## Snake

## Trinity

RECLAMATION

# All Basins' Ensembles: Issue<sub>Apr</sub>, Q<sub>Apr-Jul</sub>, Predictability Impact

## Boise

## Green

## Gunnison

## Missouri

RECLAMATION

# Uncertainties

- Climate Projections
  - specifying emissions, GCMs, initial conditions...
- Hydrologic Simulation Model
  - model structure, parameterization, weather inputs
    - historical weather used to calibrate hydrology model differs from that used to bias-correct and spatially downscale climate projections
- Water Supply Forecast Model
  - Model Structure, Predictor Selection, etc
  - Mean-Area Predictors, unrealistic information sampling
  - Why are some results so extreme (good or bad)?

RECLAMATION

# Study #2:

## Period-Change in Predictability, Pacific Northwest basins

- Acknowledgment to Univ. WA Climate Impacts Group (UW CIG) for providing simulated hydroclimate data.
- Study completed as an interagency effort sponsored by Reservoir Management Joint Operating Committee

RMJOC (2010) *“Climate and Hydrology Datasets for use in the RMJOC Agencies’ Longer-Term Planning Studies: Part I - Future Climate and Hydrology Datasets”*, prepared jointly by Bureau of Reclamation, Bonneville Power Administration, and U.S. Army Corps of Engineers, 209pp.

RECLAMATION

# Approach

## 1. Define period climates

### – UW CIG HB2860 Data:

- Historical, six scenarios of both Hybrid-Delta (HD) 2020s and HD 2040s.
- Each climate (historical, HD####) features variability from obs.1916-2006.

## 2. ...make Basin Hydroclimate data (P, SWE, Runoff)

- UW CIG's 1/16° VIC app. of the Columbia-Snake River Basin

## 3. ...make Forecast data

- Single forecast model calibrated to climate period (omniscience)
  - Unlike Study #1, no model decadal updating in-period, otherwise similar
- Spatial predictor sampling constrained to be near real monitoring!

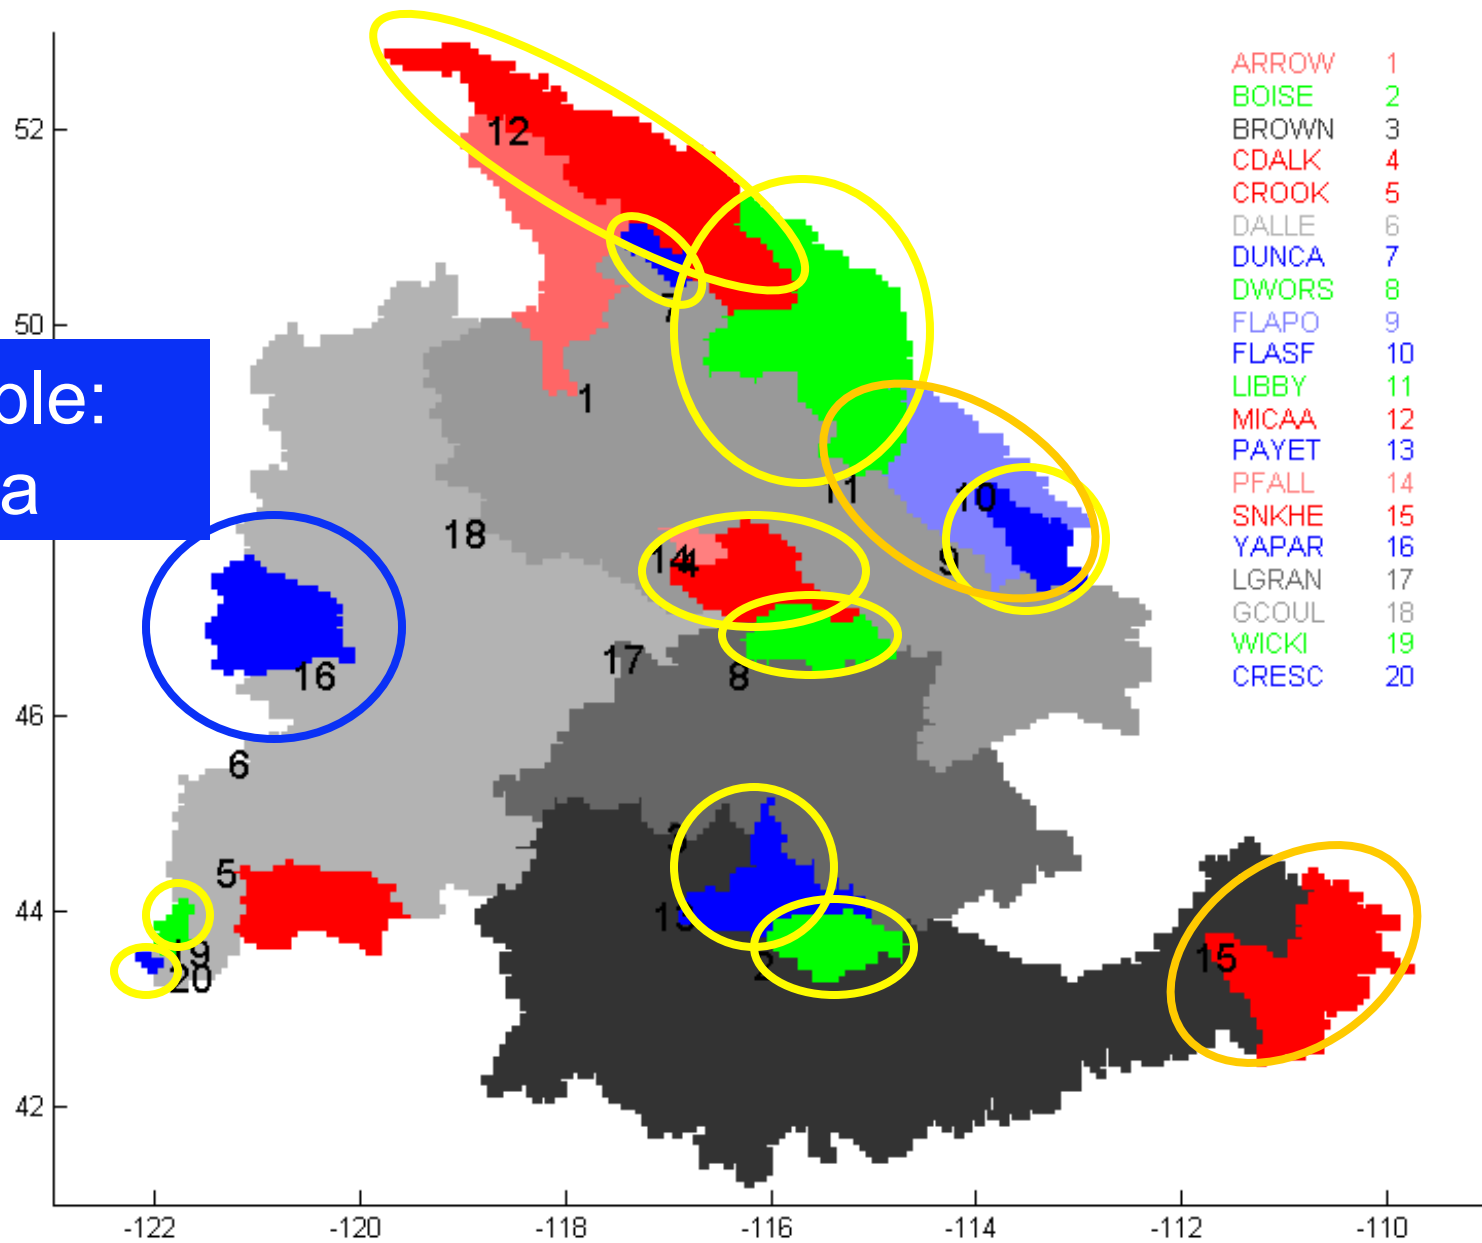

## 4. Evaluate calibration forecast skill across climates.

- Various metrics ( $r^2$ , RMSE)

RECLAMATION

## Example: Yakima

# Regression Results: $r^2$ , Historical (black) and HD 2020s

# Regression Results: $r^2$ , Historical (black) and HD 2040s

# Reactions

- For most other PNW basins, predictability in HD2020s and HD 2040s climates found to be similar to that in Historical, perhaps slightly weaker.
- Impacts on predictability seems most apparent for early Winter forecast issues and late Spring forecast issues
  - (e.g., January issues of spring-summer volume, or June issue for summer volume)...
  - This seems physically intuitive (i.e., warming leads to less early season snowpack which negatively affects early Winter forecasting, or warming leads to less late-season snowpack and negative affects late Spring forecasting).

RECLAMATION

# Summary

- We've introduced a framework for:
  - generating forecast projections consistent with hydroclimate projections (Study #1)
  - generating period-shifts in forecast characteristics consistent with hydroclimate changes (Study #2)
    - We're apply Study #2 framework within the RMJOC reservoir operations impact assessment.

RECLAMATION

# Summary

- Predictability impacts:
  - (Study #1) onset of reduce predictability appears to vary among Western U.S. basins; sooner for basins with more “at-risk” snow...
  - (Study #2) early- to mid-21<sup>st</sup> century, it appears that early Winter and late Spring forecast issues will be impacted first... However, results were limited to sampling predictor information from real-world monitoring. Are these locations ideal for forecasting service in the future?
